AI Skunkworks Project

Object Recognition using Capsule Networks

Proposal Of Project:

This project aims to create 3D model of images using Autodesk Maya(a 3D computer graphics application) and take pictures of the image in 360 degrees so that positional and relative locations are properly stored and captured. Accordingly, the database is created with these images and they are labeled.

Furthermore, the deployment process can be automated by setting up CICD(continuous integration and continuous delivery) pipeline.
